Write a Python program that reads the birth date and salary of employees.

**Input Format:**

The input consists of:

A string representing the birth date of the employee in the format $DD - MM - YYYY$.

A floating-point number representing the salary of the employee in rupees.

**Output Format:**

The output should include:

The age of the employee.

The salary of the employee in dollars.

**Note:**

1INR=0.012USD

File Edit Format Run Options Window Help

```python
from datetime import datetime

# Input
birth_date = input("Enter birth date (DD-MM-YYYY): ")
salary_inr = float(input("Enter salary in INR: "))

# Convert birth date string to date object
dob = datetime.strptime(birth_date, "%d-%m-%Y")

# Get today's date
today = datetime.today()

# Calculate age
age = today.year - dob.year - ((today.month, today.day) < (dob.month, dob.day))

# Convert salary to USD
salary_usd = salary_inr * 0.012

# Output
print("Age of the employee:", age)
print("Salary in USD:", round(salary_usd, 2))
```

## 1.1.5. Multiplication Table

Write a Python program that takes an integer as input and prints the multiplication table for that integer from 1 to 10.

**Input Format:**
The first line of input contains an integer that represents the number for which the multiplication table is to be printed.

**Output Format:**
Print the multiplication table for the given number .
